

# INTERNSHIP TASK 3

## Cloud Powered Blog Platform

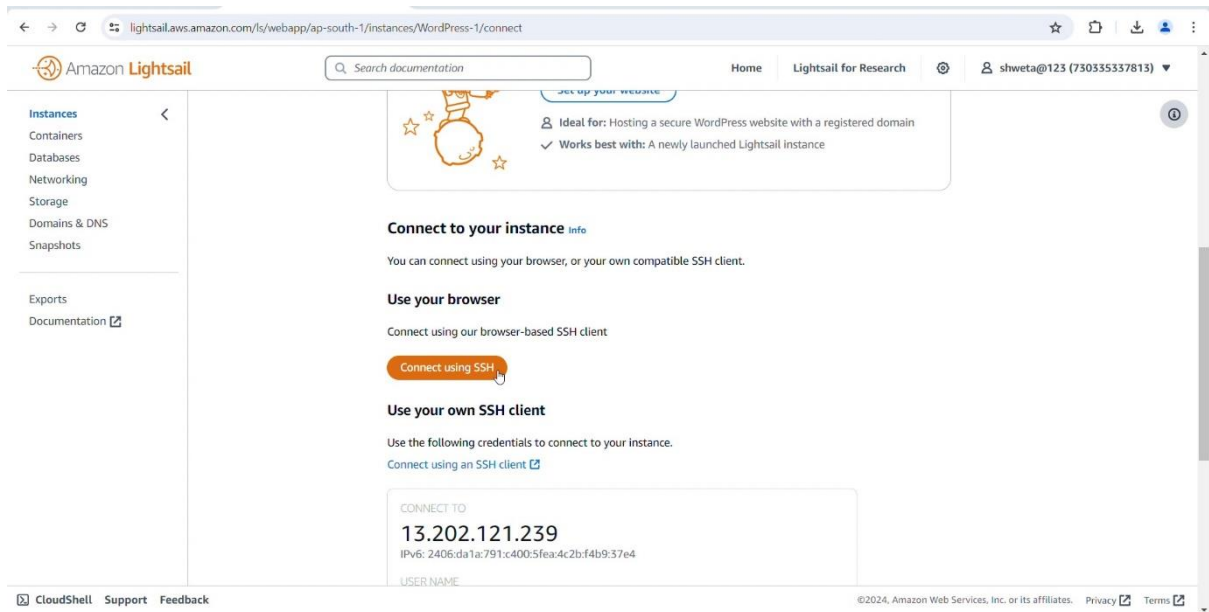

- To create a cloud-powered blog we use service lightsail in which we will first create an instance. In which we select Linux platform.

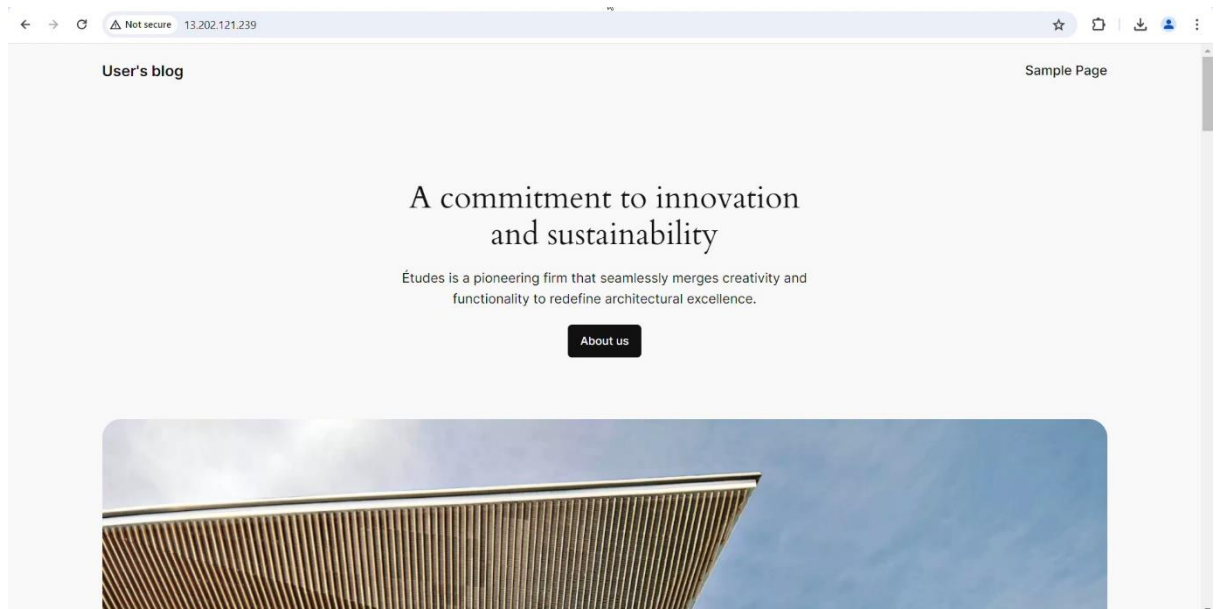

- And now we will create and attach a static ip.

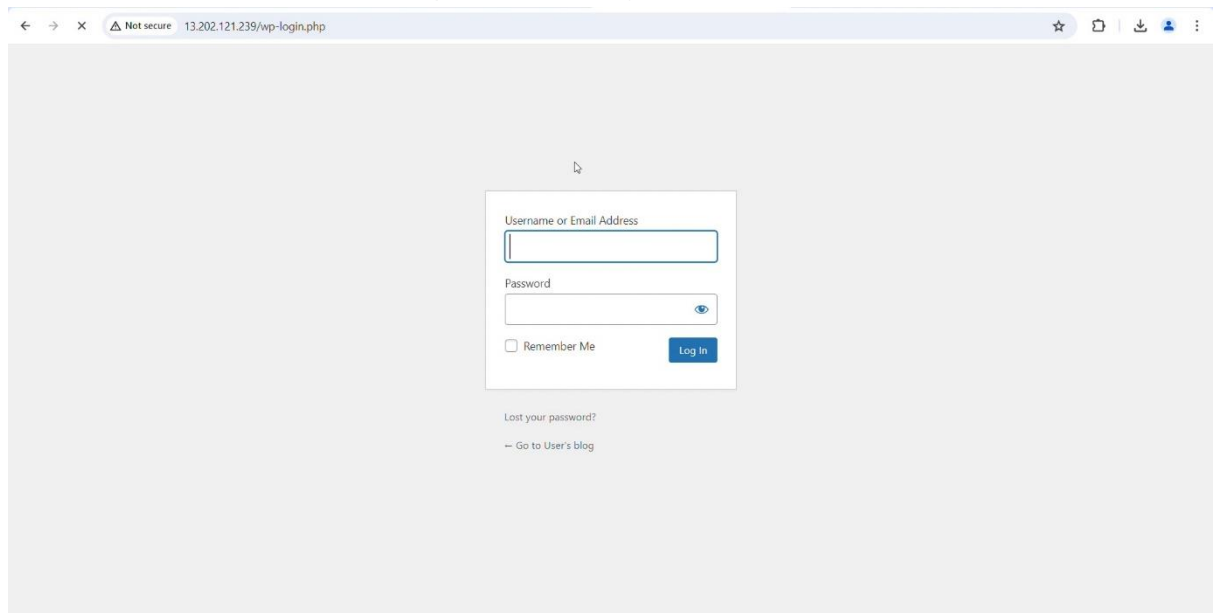

- Now we will connect it using SSH.

- And then we will copy the static ip address and paste it in new tab.

- In another tab we will login to wordpress.

- In the post section we will select new page and we will create our cloud powered blog and publish it and then copy the blog URL and paste it in new tab and our cloud powered blog is ready.
